

PEPHA®-CTIVE — AN INNOVATIVE SKIN ENERGISER

Over time depending on our life style and environment, our skin becomes stressed and tends to lose its initial energy level. Low cell revitalization, insufficient blood supply and reduced cell renewal will leave your skin brittle, stressed out and dull looking.

PEPHA®-CTIVE is a biotechnologically produced extract of the microalga *Dunaliella salina*, which reloads the skin with new energy. The microalga *Dunaliella salina* is unique in that its natural habitat is in salt lakes that have a salinity which is nine times higher than the salinity of sea water. Since *Dunaliella salina* is continually exposed to all kinds of stress like high osmotic pressure, high UV-levels and high oxygen levels it is considered as a stress manager. To withstand these conditions the alga needs a lot of energy, which clearly differentiates it for its outstanding skin energizing properties.

Dunaliella salina is cultivated by a special fermentation technology and its highly purified extract is processed to PEPHA®-CTIVE. This powerful cocktail of different molecules such as amino acids and carbohydrates has the ability to reload the skin with new energy. PEPHA®-CTIVE protects and stimulates the mitochondria, the energy centre of the skin cells and enhances the ATP-levels to provide the skin with new energy. As cell renewal is increased, it improves the overall skin complexion, leaving you with a youthful looking luminous skin.

If you are looking for a natural and efficient way to revitalise your stressed out, tired looking skin around your eyes, eyeSlices® is the perfect solution for you.
